

PUZZLE: Developing easy to read formats for people with intellectual disabilities

How to take photos with different devices

Most mobile devices and many laptops and computers have an inbuilt camera that can take photos. These include smart phones, iPads, mobile tablet and 'phablet' devices:

Each device will work in a slightly different way, but this general advice should help you use your device to take a photo.

1. LOCATE THE CAMERA ICON - Look for a camera icon on the 'Home Screen' or wherever the 'Apps' on the device are listed or displayed. You may have to swipe through more than one screen of apps before you find the camera icon, but usually this will be found on the first screen, like in the examples below:

2. OPEN THE CAMERA by tapping the camera icon – The camera App will display the camera viewfinder window with some camera control buttons and tools around the frame/edges of the screen.

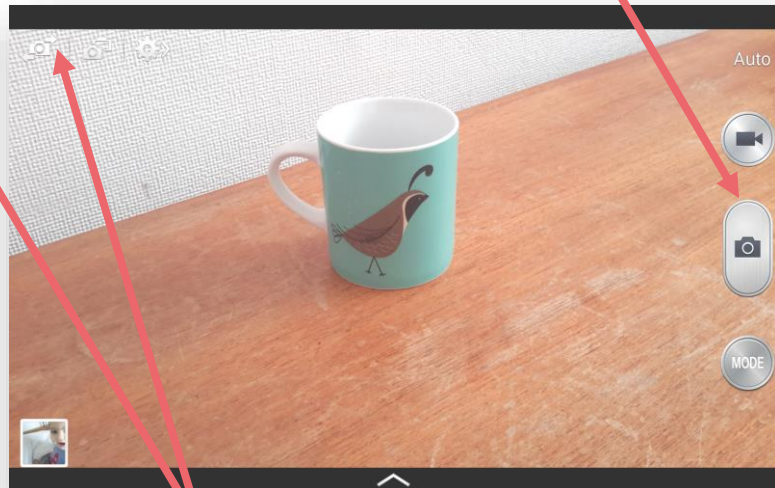

PUZZLE: Developing easy to read formats for people with intellectual disabilities

Different devices will have slightly different camera controls and tools, but all devices should have:

A button you press to take a photo - usually the biggest button on the screen.

A button you press to switch from using the front camera to the back camera – usually a camera icon with directional arrows.

3. POSITION THE CAMERA so that what you want to take a picture of is clearly visible and well positioned in the viewfinder window.

4. TAKE A PHOTO by clicking the big 'take photo' button.
